Priority Number: Dec. 10, 1998 JP1998000368466

Abstract: A wafer polishing stop detection method and polishing stop detection device which provides the method for detecting CMP polishing stop by polishing surface status index of polishing wafer in more precision. The solution of the wafer polishing stop detection method is irradiating the light from the light source; collecting the reflection on the color recognition sensor using fiber optics for light color component recognition; recognizing the color components of the tracing material on the pre-polished wafer using the color recognition sensor; displaying an "on" status if the color components are recognized and an "off" status if the color components are not recognized; digitally displaying the "on" and "off" periods on the horizontal axis during wafer polishing from a point (except the center) on the rotating wafer surface irradiated by the color recognition sensor; detecting the integral (&Sgr;m) for the specified period for "off" pulse width in digital display so that when the detected integral (&Sgr;m) can be consistent with the integral value (&Sgr;n) for the specified period for "off" pulse width of predetermined best wafer polishing stop, defining it as the wafer polishing stop.
